

## M25 Stabilized Binoculars

M25 Stabilized Binoculars have 14-power optics that will allow Soldiers to identify targets and assess battle damage at extended ranges while providing increased on-the-move sighting capability. They are direct view optical devices (in the day mode). The M25 is stabilized by a precision miniature gyroscope mounted on a gimbal platform in the middle of the optical pathway. The platform holds the prisms; if they are held steady, the image remains steady regardless of the movement of the objective and eyepiece lenses.

### Performance Characteristics

- Powered by two AA batteries that provide at least 8 hours of use
- The precision optics in the M25 enable extremely high resolution that roughly equates to the user being able to see a golf ball a mile away
